# On Types of $S_{\beta}$ - Functions

Hashmiya Ibrahim Nasser

Department of Math. - AL-Qadissiya Education jaberabrahim @ yahoo. com

#### Abstract

In this paper we introduce and study another types of functions in a topological spaces namely,  $S_{\beta}$ -compact and  $S_{\beta}$ -coercive by using the concept of  $S_{\beta}$ -open sets. Also we investigate some properties of these concepts and the relation between them.

Keywords:  $S_{\beta}$ -open,  $S_{\beta}$ -closed,  $S_{\beta}$ -compact space,  $S_{\beta}$ -continuous,  $S_{\beta}$ -compact,  $S_{\beta}$ -coercive.

الخلاصة

## Introduction

In 1963, Levine initiated the notation of semi-open (briefly S-open) sets and study their properties of this concept. Throughout the properties in topological spaces. In 1982, AbdEl-monsef defined the class of  $\beta$ -open set. Also in 2012, Kalaf B. and others were introduced a new concept denoted by  $S_{\beta}$ -open set. Finally, in 2013, Kalaf B. and Ahmed K. wre introduced a new type of compact spaces namely  $S_{\beta}$ -compact. Present paper, (X,T) and (Y,T') (or simply X and Y) denote topological spaces. The closure (resp. interior) of a subset A of a space X which denoted by cl(A) (resp. int(A)). A subset A of X is called S-open (resp.  $\beta$ -open), if  $A \subseteq cl(int(A))$ ). The complement of S-open (resp.  $\beta$ -open ) set is called S-closed (resp.  $\beta$ -closed) set.

Finally in section two, we give some basic properties of new types of functions and relation between them .

## 1. Basic definitions and notations:

We introduce some elementary concept which we need in our work.

## 1.1. Definition: [Al-Sheikhly, 2003]

A topological space **X** is called:

i. Locally indiscrete if every open subset of X is closed.

ii. Hyper-connected if every non-empty open subset of is dense.

#### 1.2. Definition: [Kalaf, 2012]

i. A *S*-open subset *A* of a topological space *X* is called  $S_{\beta}$ -open if for all  $x \in A$ , there is a  $\beta$ -closed set *F* such that  $x \in F \subseteq A$ . A complement of  $S_{\beta}$ -open is called  $S_{\beta}$ -closed.

ii. A subset A of a topological space X is called  $S_{\beta}$ -open if and only if A is S-open and it is a union of  $\beta$ -closed sets.

iii. A subset N of a topological space X is called  $S_{\beta}$ -neighborhood of a subset A of X, if there is a  $S_{\beta}$ -open set U such that  $A \in U \subseteq N$ . When  $A = \{x\}$  we say that N is  $S_{\beta}$ -neighborhood of x.

#### Journal of Babylon University/Pure and Applied Sciences/ Vol. (26), No. (3), 2018

iv. A topological space X is called  $S_{\beta}$ -compact, if for every  $S_{\beta}$ -open cover of X has finit subcover. Clearly, every S-compact space is  $S_{\beta}$ -compact.

## 1.3. Remark: [Kalaf, 2013]

i. If X is a  $T_1$ -space, then every  $S_\beta$ -open subset in X is S-open.

ii. A space X is hyper-connected if and only if a  $S_{\beta}$ -open subsets of X are  $\emptyset$  and X.

iii. If a space X is locally indiscrete, then every S-open subset of X is  $S_{\mathbb{B}}$ -open.

#### **<u>1.4. Theorem:</u>** [Kalaf, 2012]

i. If B is clopen subset of a topological space X and A is open, then  $A \cap B$  is  $S_{\beta}$ -open.

**ii.** Let  $A \subseteq Y \subseteq X$ , if A is  $S_{\beta}$ -open subset in X and Y is open subset in X, then A is  $S_{\beta}$ -open subset in Y.

iii. Let  $A \subseteq Y \subseteq X$ , if A is  $S_{\beta}$ -open subset in Y and Y is clopen subset in X, then A is  $S_{\beta}$ -open subset in X.

#### **<u>1.5.Definition:</u>** [Al-Sheikhly, 2003;Kalaf, 2013]

Let  $f: X \to Y$  be a function, then f is called:

i. 5-compact if the inverse image for every compact set in Y is 5-compact set in X.

ii.  $S_{\mathcal{B}}$ -closed if the image for every closed set in Y is  $S_{\mathcal{B}}$ -closed set in X.

ii.  $S_{\beta}$ -irresolute if the inverse image for every  $S_{\beta}$ -open set in Y is  $S_{\beta}$ -open set in X.

## 2. Type of *S*<sup>*β*</sup>-Functions:

In this section, we introduce a new  $S_{\beta}$ -functions called  $S_{\beta}$ -compact and  $S_{\beta}$ -coercive functions.

## 2.1. Definition:

A function  $f: X \to Y$  is said to be  $S_{\beta}$ -compact if the inverse image for every compact set in Y is  $S_{\beta}$ -compact set in X.

## 2.2. Example:

i. An identity function  $f:(X,T) \to (X,T')$  with  $X = \mathcal{R}$ ,  $T = \{ \phi, X, \{0\} \}$  and  $T' = T_{ind}$  is  $S_{\mathcal{B}}$ - compact.

ii. Let  $X = \{1, 2, 3\}$  and  $Y = \{2, 4, 6\}$  with topologies  $T = T_{incl}, T' = \{\emptyset, Y, \{4\}\}$  resp. A function  $f: X \to Y$  defined by  $f(x) = 2x, \forall x \in X$  is  $S_{\beta}$ -compact, since X is locally indiscrete space [ by using remark (1.3.iii)].

The following example shows that not every function is  $S_{B}$ -compact.

## 2.3. Example:

Consider a countable set X with co-countable topology, then the constant function from X into any space Y is not  $s_{B}$ -compact.

#### 2.4. Theorem:

Every *s*-compact function is  $s_{\beta}$ -compact.

**Proof**: By using definition (1.2.iv), this is just the condition of our theorem.

The converse of the Theorem above is not true in general as the example shows: **5 Example**:

## **2.5. Example:**

Let  $X = \mathcal{R}$  with topology  $T = \{\emptyset, X, \{0\}\}\$ , then a function  $f: (X,T) \to (X,T_U)$  which defined by  $f(x) = 0, \forall x \in X$  is  $S_\beta$ -compact, but not S-compact.

In general a  $S_{\beta}$ -compact and compact functions are independent as the following examples:

#### 2.6. Example:

A function in example (2.3) is compact, but not  $s_{B}$ -compact.

## 2.7. Example:

Let X = (0,1) with topology  $T = \{\emptyset, X, G = (0, 1 - \frac{1}{n})\}, n = 2, 3, \dots$ . A constant function f from a space X is a  $S_{\beta}$ -compact, but not its compact.

Recall that every 5-compact function is compact [Al-Sheikhly H. 2003], the converse is not true as the following example shows:

#### 2.8. Example:

Let  $X = I \cup \{x\}$  with I uncountable set and  $x \notin I$ , let  $T = \{\emptyset, X, \{x\}\}$  be a topology on X, a constant function from X into itself is compact but not S-compact, because X is not S-compact space, since  $\{\{x, x_i\} : i \in I\}$  is a S-covering of X but has no finite subcover.

## 2.9. Theorem:

Let  $f: X \to Y$  be a  $s_{\beta}$ -compact function and A be a clopen subset of X, then  $f_{|A}: A \to Y$  is also  $s_{\beta}$ -compact.

#### **Proof:**

Let K be a compact subset of Y, then  $f^{-1}(K)$  is  $S_{\beta}$ -compact set in X, since A clopen in X. Then by Theorem (1.4.iii),  $A \cap f^{-1}(K)$  is a  $S_{\beta}$ -compact set in A, but  $A \cap f^{-1}(K) = f_{|A|}^{-1}(K)$ , then  $f_{|A|}$  is  $S_{\beta}$ - compact.

#### 2.10. Remark:

A composition of two  $S_{\beta}$ -compact functions not necessary  $S_{\beta}$ -compact.

## 2.11. Theorem:

Let  $f: X \to Y$  and  $g: Y \to Z$  be two functions, then:

i. If f and g are  $s_{\beta}$ -compact and Y be a locally indiscrete, then gof is  $s_{\beta}$ -compact.

ii. If f and g are  $s_{\beta}$ -compact and Y be a  $T_1$ -space, then **gof** is  $s_{\beta}$ -compact.

iii. If g compact and f be a  $S_{B}$ -compact, then  $g \circ f$  is  $S_{B}$ -compact.

iv. If g be a S-compact and f be a  $S_{\theta}$ -compact, then gof is  $S_{\theta}$ -compact.

#### 2.12. Definition:

A function  $f: X \to Y$  is said to be  $s_{\beta}$ -coercive if for every  $s_{\beta}$ -compact subset B of Y there is  $s_{\beta}$ -compact subset A of X such that  $f(X/A) \subseteq (Y/B)$ .

#### 2.13. Example:

i. The identity function for any space is  $S_{ff}$ -coercive.

ii. Let  $X = \{1, 2, 3\}, Y = \{4, 5\}, T_X = \{\emptyset, X, \{3\}\}, T_Y = T_{ind} \text{ and } f: X \to Y \text{ be a function}$  which defined by f(1) = f(2) = 4, (3) = 5, then f is  $S_\beta$ -coercive.

## 2.14. Theorem:

A  $S_{\beta}$ -compact function from  $S_{\beta}$ -compact space is  $S_{\beta}$ -coercive.

#### Proof:

Let  $f: X \to Y$  be a  $S_{\beta}$ -compact function and let **B** be a  $S_{\beta}$ -compact subset of Y. Since X be a  $S_{\beta}$ -compact. Then  $f(X/X) = \emptyset \subseteq f(Y/B)$ , thus f is  $S_{\beta}$ -coercive.

#### **2.15. Theorem:**

A restriction  $S_{\beta}$ -coercive function on clopen subset is  $S_{\beta}$ -coercive.

## **Proof:**

Let  $f: X \to Y$  be a  $s_{\beta}$ -coercive function and F be a clopen subset of X, to show that  $f_{|F}: F \to Y$  is a  $s_{\beta}$ -coercive function, let B be a  $s_{\beta}$ -compact subset of Y. Then there is a  $s_{\beta}$ -compact subset A of X such that  $f(X|A) \subseteq (Y|B)$ . Since F be a clopen subset of X, then by Theorem (1.4.iii),  $F \cap A$  is  $s_{\beta}$ -compact subset of F. Since  $f_{/F}(F \cap A) = f(F|A)$  and  $F/A \subseteq X/A$  $\Rightarrow f(F|A) \subseteq f(X|A) \Rightarrow f_{/F}(F/F \cap A) \subseteq Y/B$ , hence  $f_{/F}: F \to Y$  is  $s_{\beta}$ -coercive function.

## 2.16. Theorem:

A composition of two  $s_{\beta}$ -coercive functions is  $s_{\beta}$ -coercive.

**Proof:** Clear.

Recall that the  $s_{\beta}$ -irresolute image of  $s_{\beta}$ -compact is  $s_{\beta}$ -compact [ Kalaf K. 2012].

## **2.17. Theorem:**

Let  $f: X \to Y$  and  $g: Y \to Z$  be two functions such that:

i. If **gof** is  $S_{\beta}$ -coercive with g is  $S_{\beta}$ -irresolute and one to one, then f is  $S_{\beta}$ -coercive.

ii. If **gof** is  $S_{\beta}$ -coercive with f is  $S_{\beta}$ -irresolute and onto, then g is  $S_{\beta}$ -coercive.

## **Proof:**

i. Let B be a  $S_{\beta}$ -compact subset of Y, then g(B) is a  $S_{\beta}$ -compact subset of Z. Since  $g \circ f$  be a  $S_{\beta}$ -coercive, then there is a  $S_{\beta}$ -compact subset A of X such that  $g \circ f(X/A) \subseteq Z/g(B)$ , then:

 $\begin{array}{l} f(X/A) = g^{-1}(\ gof(X/A)) \subseteq g^{-1}(Z/g(B)) = g^{-1}(Z \cap \left(g(B)\right)^{c}) = g^{-1}(Z) \cap g^{-1}(g(B^{c}))) = Y/B \end{array}$ 

,thus

f is  $S_{\beta}$ -coercive function.

ii. Let C be a  $s_{\beta}$ -compact subset of Z. Since  $g \circ f$  is  $s_{\beta}$ -coercive, then there is a  $s_{\beta}$ compact subset A of X such that  $g \circ f(X/A) \subseteq Z/C$ , thus  $g(f(A^c)) \subseteq Z/C$ ,
since f onto we get  $g((f(A))^c)) \subseteq Z/C$ . Then f(A) is  $s_{\beta}$ -compact subset of Y.
Thus g is  $s_{\beta}$ -coercive function.
